

IN THE CLAIMS:

Please cancel claim 3 without prejudice or disclaimer, with claims 1 and 2 maintained as follows:

1. (Previously Presented) A liquid crystal display device comprising a first substrate and a second substrate which are arranged to face each other with a liquid crystal layer therebetween, wherein the first substrate includes a plurality of gate lines which extend in a first direction, a plurality of drain lines which extend in a second direction, and holding capacitance lines which extend in the first direction parallel to the gate lines and crossing the drain lines, wherein

a pixel and a switching element are provided to a region which is surrounded by two neighboring gate lines out of the plurality of gate lines and two neighboring drain lines out of the plurality of drain lines,

the pixel includes a light transmitting region which allows light incident from a back surface of the first substrate to pass therethrough and a light reflecting region which allows light incident from the second substrate side to be reflected thereon,

the light transmitting region includes a first pixel electrode having the light transmitting property and the light reflecting region includes a second pixel electrode having the light reflecting property,

an insulation film and a holding capacitance electrode which extends in the second direction and is connected to one of the holding capacitance lines are provided below the second pixel electrode,

the holding capacitance electrode is formed on the same layer as the gate lines,

a boundary between the light transmitting region and the light reflecting region is shaped rectangular and has two first sides extending in the first direction and two second sides extending in the second direction,

at least one of the holding capacitance lines is formed in an overlapped manner to one of the first sides, and is formed of a material having a light shielding property, and

the holding capacitance electrode is formed in an overlapped manner to at least one part of the second sides, and is formed of a material having a light shielding property.

2. (Original) A liquid crystal display device according to claim 1, wherein the first pixel electrode is formed over the holding capacitance electrode and a holding capacitance is formed by way of an anodized film formed over the holding capacitance electrode.
3. (Canceled).
